ABSTRACT

Website is a communication media that is connected to the internet network where users can provide information about information that is important in the current era. One of them is the Village Website. The village website has news about information that is fast and accurate, making it easier for users to obtain information about news about villages, population, tourism, or local products. User Interface is one of the main problems that are often faced in website development. because there are several reasons regarding the User interface has a less attractive appearance both in terms of appearance or other views. The Village website has never been evaluated before, so this can support the developer. It is necessary to carry out further analysis of the Village Website in order to find out whether the Village Website has met the criteria for its use or not. The purpose of this analysis is to be able to find out specifically as an evaluation material if later improvements will be made before being widely published. This study uses the System Usability Scale (SUS) method, which is one of the appropriate methods to determine the success of the Village Website.

Kata Kunci : *System usability Scale, SUS, Village Website, Usability*
