ABSTRACT

NU Banyuwangi Hospital does not have an official website that is used for information media and information dissemination only conventionally such as with banners and pamphlets in hospitals, so this is very inefficient in terms of time and distance. The public must come to the hospital to find out the information in the hospital. So that hospitals need information dissemination media that can provide information to the wider community, namely by using online media such as websites. The purpose of this research is to design and manufacture a Website as a Home care Service Media which can simplify the service process and improve the quality of service at the NU Hospital in Banyuwangi Regency. The sistem design method uses the waterfall method which consists of analysis, design, coding, and testing. Data collection techniques using observation, interviews, and documentation. The results of this research are a Website as a Home care Service Media for the public who can obtain information about services and other information without having to come directly and ask hospital staff and there are patient Home care services and online consultations to make it easier for patients to get medical services at home so that minimize the effects of a disease.

Keywords: *home care services, online consultation, waterfall, website*
