***ABSTRACT***

*At present the development of technology is very rapid and continues to increase. Society's need for technology is also growing. Currently many companies, shops, pharmacies and others are using information systems. A clothing store needs information that can help control the entry and exit of goods in the store. The Sunshine Store is an example of a store that requires an information system. The required information system is an information system that handles incoming and outgoing goods, the number of goods and inventory. Therefore researchers use the reorder point method by paying attention to safety stock or commonly called safety stock. By using this method website users can get the advantage of being able to see stock inventory without having a shortage of stock due to the availability of a warning when the stock has reached a safe limit.*
