ABSTRACT

Informed consent form is a form that contains consent for medical action from a patient to a doctor after an explanation of what medical action will be put into action. Based on a preliminary study at the Dringu Health Center in June 2022, information was obtained that the most common medical procedure performed at Dringu Health Center was tooth extraction, reaching 108 medical action. Design of the form used is not by the standards, does not include other information and there is only one type of medical action form for all types of services . This study aims to carry out analysis and design on the previous form. The method used qualitative and data collection techniques using observation, interviews and focus group discussion (FGD). The subjects of this study were medical recorders, dentists, registrars and heads of public health center. The result of this research based on physical aspects that is F4 paper weight 80 gram, white color and rectangle shape. For the anatomical aspect of the addition of the head of the form (heading), instructions, body of the form which includes margins, ruler and type style as well as closing which includes place, date, full name and signature. As for the content aspect there are additional items of information on the patient identity, information related to the action and adjustments to the sequence and terms used. It should be necessary to carry out repeated or periodic evaluations to assess whether the design of the medical action consent form is still relevant for use.
