ABSTRACT

The neonatal preliminary assessment form is one of the important forms, because it includes information about newborns. Baladhika Husada Hospital in Jember is one of the hospitals which still does not have a preliminary assessment form specifically for newborns or neonates, there still uses initial assessment forms for general patients. The purpose of this study was to design a neonatal initial assessment form at Baladhika Husada Hospital Level III Jember. This type of research is a qualitative study with research subjects including Sp.A doctors, midwives, nurses, chief medical records, and medical records officers. Data collection techniques in this study used interviews, observation, brainstorming. The results of this study were seen from the physical aspects of the neonatal initial assessment form using white paper with a size of 70 grams F4 (33 cm and 21.5 cm) in portrait form. Viewed from the anatomical aspects of the neonatal heading assessment form, the logo, the name of the agency, the address of the agency, and the title of the form, for the introduction, are represented by the title. Viewed from the aspect of the contents of the neonatal preliminary assessment form, the data added consisted of obstetric status, anthropometric vital signs, apgar score assessment, and physical examination starting from B1 - B7. Suggestions from researchers on the results of the neonatal initial assessment form design are expected to be implemented at Baladhika Husada Hospital Level III Jember.
