ABSTRACT

This research aims to determine and analyze the implementation of the Village Asset Management System (SIPADES) in Suci Village, Panti District, Jember Regency. This research uses a descriptive qualitative method where data is collected in the form of narratives or images that do not emphasize numbers. Data was obtained through direct interviews with sources, observation and documentation at Suci Village. This research shows that the implementation of the Village Asset Management System in Suci Village still encounters many obstacles such as a lack of training and assistance in the Village Asset Management System (SIPADES). In operation, this system still frequently experiences errors, and there is a lack of understanding by village officials in using SIPADES. This was overcome through intensive coaching, mentoring and training efforts for the Suci Village government regarding the operation and use of SIPADES. This assistance must continue on an ongoing basis until the village government is able to utilize SIPADES effectively and in a structured manner.
