***ABSTRACT***

*Network thin client is the concept of optimization of server resources to perform centralized computing and distribution of resources through which the entire user activity on the local computer network . Server performance optimization aimed at minimizing data processing activities on the user's device which only act as input and output devices of the system. Diskless is one method of designing networks that use a thin client computer with lower specifications as the terminal user input and output devices .*

*Keywords : Thin Client, Diskless*
