

ABSTRACT

Al-Baitul Amien Jember School is one of the schools that uses the admission of new students manually or still with a conventional system. This can be difficult if data buildup and data search occurs. Especially if at any time the data search and addition of data will reduce the efficiency of the time available. The need for a long process in selecting existing files and publish them. From the above problems the author helps by creating a "Web-Based Admission Information System for Al-Baitul Amien Jember School". It is expected that this application can facilitate users in the acceptance of new students and can streamline the time in the process of admission of new students. The making of this application uses the CodeIgniter Framework as a web application network and utilizes Hosting as a place to store data on the internet and implement applications on the website. The research method used is the SDLC method by several steps.

Keywords: CodeIgniter Framework, Hosting, SDLC, Information Systems.
