ABSTRACT

The management of medical record file storage is very important to do in a service institution. According to the interview with the chief medical recorder at RSUD Tongas Probolinggo, there are some mistakes in the medical record file storage system, the medical record file storage system does not contain SOP, the wrong centralized storage system where the outpatient medical record file is separated from the inpatient and igd files but still in one rack, it results in a stack of medical records, and there is a misplaced missfile medical file. The research is qualitative research. Methods of data collection used with interviews and observation. Results of data used primary and secondary data. Based on the 5M element of Element man, the officer of the medical record file storage department has the last education graduate of D3 Medical Record and D4 Medical Record 2 people and the 2 persons who are not the medical recorder. Based on the Money element there is no special budget. Based on the Methode element, there is no SOP of the medical record file storage system and there is only a SNF alignment system. Based on Machine element showing medical record storage rack using o'pack roll rack and using wooden rack. Storage room still not meet the standards. Based on the Material element there is no tracer to find out the medical record file borrowed. Medical record file folders are standard.
