### ***ABSTRACT***

*The aim of this research is to known the effect of feeding frequency on broiler performance. Experimental method using Completely Randomized Design (CRD), with 4 treatments and 6 replications ie P0 (2x for 21 days), P1 (week I: 6x, week II: 4x times, week III: 2x), P2 (week I : 5 x, week II: 3x, week III: 2x), P3 (2x for 21 days). The results showed that the effect of feeding frequency had no significant effect ( $P > 0,05$ ) on feed consumption. but highly significant effect on body weight gain and feed conversion ( $P < 0,01$ ). Frequency of the first week 6 times / day, second week 4 times / day, third week 2 times / day, can be applied to get the best broiler performance from 1 to 21 days.*
