ABSTRACT

Based on the first survey, the researcher found that from 30 informed consent's sheet there are 12 (40%) sheets uncompletely. The purpose of the research is to observe some factors which is has relationship with inpatients knowledge about informed consent's sheet. This research is using an observational analytic research with cross sectional approach. The population and sampel of the research are all of patients that have given medical treatment and will be listed at hospital's medical record. The submitting data method is interview using a checklist. And the data analyze is using spearman. This research shows that from 94 correspondences there are 92 correspondences unwell knowledge. There are 37 correspondences are getting some information from the doctor and 59 correspondences may not. From the all of correspondences, 69 correspondences that ever be inpatients. Beside that, there are 16 correspondences never get any education, 68 correspondences are graduated from elementary school, 6 correspondences are from junior high school, 3 correspondences from senior high school, and a correspondences from university. From the all of correspondences there are 26 correspondences are jobless, 3 correspondences are civil employee, 5 correspondences are employee, 5 correspondences are seller, and 55 correspondences are worker. The degree of inpatients knowledge about an informed consent's sheet is unwell. Based on the experience, that found a relation to inpatients knowledge about informed consent's sheet. But there is not between information, education and job with inpatients knowledge.
