ABSTRACT

The government of Kabupaten Bondowoso to improve farm products particularly cattle production do through some policy: (1) extension program (2) Artificial insemination and (3) forage development. Although been launched the program , there are still problems, which is indicated by a decrease in population of cattle, the decline results of artificial insemination and a decrease in meat production.

The purpose of this research to find out the effect of extension program, artificial insemination and development of forage on the increase production of cattle in Kabupaten Bondowoso. This research is an explanation using SEM analysis. The results show that extension program does not affect the improvement of beef cattle production in Kabupaten Bondowoso. Artificial insemination and the development of forage have had a positive impact significantly to the increased production of beef cattle in Kabupaten Bondowoso .

Key words : extension program, artificial insemination, forage development,
