ABSTRACT

Medical records are files that contain records and documents, including identity, the patient, the results of the examination, the treatment that has been given, as well as other actions and services that have been provided to the patient. The Kalisat Health Center does not yet have an emergency unit medical record form so that when a patient comes to receive emergency service, the officer fills in patient data using an outpatient medical record form. The researcher wants to design a new form design based on the content aspect, anatomical aspect and physical aspect. Data collection techniques used were observation, interviews and brainstorming. This type of research is descriptive qualitative. The results of this study are on the physical aspect using 80 gram HVS paper, the anatomical aspect includes the name of the puskesmas on the head of the form and the title of the form, the instructions or instructions with a margin of 1.5 on the content aspect by adding items to the clinical data, patient identity data, informed consent, and follow-up plan, the items were sorted according to the group of items. It is hoped that later the results of this design can make it easier for officers to fill out emergency files at the Kalisat Jember Health Center.
