ABSTRAK

Along with the rapid advancement of technology, and the need for information to be quickly delivered. And here the author intends to implement and introduce a web-based application for the purposes of easier access to information, especially about the value required by the students of SDN 02 tiles. SDN 02 tiles themselves are still not using any program or application, all of which are still working on the manual and need time to process and publish the results were pretty long enough. Besides requiring considerable time, another constraint which allows elimination of value that occurs is announced through the bulletin board or any party inadvertently tearing paper announcement value. By using the PHP programming language and theme display bootstrap, this web application is made. With the Web-based application or guardians of students who have access rights can see the value anywhere and anytime.
